Google is starting a new program that will pay security researchers a \$500 bounty for every security bug they find in Chromium, the open-source codebase behind the Google Chrome browser, as well as for bugs found in Chrome itself.

Google is starting a new program that will pay security researchers a **\$500**

bounty for every security bug they find in Chromium, the open-source codebase behind the Google Chrome browser, as well as for bugs found in Chrome itself.

The company said Thursday that the plan is both meant as a reward for researchers who have been contributing bugs to the project already, and as a way to encourage other researchers to find security flaws in **Chromium**. Google said it will pay a base bounty of \$500 for most bugs contributed, but may raise the payment to \$1337 for bugs that are “particularly severe or particularly clever.” The program is modeled after one started some time ago by **Mozilla**, which also pays \$500 bounties.

In addition to paying for bugs in Chromium and Chrome, Google said it may buy bugs discovered in plug-ins and components.

“In addition, bugs in plugins that are part of the Chromium project and shipped with Google Chrome by default (e.g. Google Gears) may be eligible. Bugs in third-party plugins and extensions are ineligible,” the company said.

Other organizations have been buying vulnerabilities privately for several years now, most notably the **Zero Day Initiative** from Tipping Point, and VeriSign’s **iDefense Labs** unit. Those companies pay far more than \$500 for vulnerabilities, and researchers say that private organizations, such as government agencies, routinely pay tens of thousands of dollars for critical remotely exploitable bugs in popular software.
